

# **COMMON DRUG FORMULARY**

REVISION: 1, 1-18-2006

## **PREAMBLE**

This Formulary will be known as the State of California Common Drug Formulary. This formulary has been approved and accepted by the Common Drug Formulary and the Common Drug Formulary Pharmacy Advisory board. The directors of the Department of Mental Health; California Department of Corrections and Rehabilitation; Department of Developmental Services; Department of Juvenile Justice; and the California State University System have agreed to include Common Drug Formulary Drugs in their departmental Formularies.

It shall be the goal of the Common Drug Formulary Committee to assist member departments, as an integral part of their health care delivery systems, to identify pharmaceutical products that are the most medically appropriate and cost-effective while assuring the continuity and standardization of medication care. Selection of all pharmaceuticals for the Common Drug Formulary will emphasize patient safety, efficacy, high quality and best value for the population served.

## **POLICY STATEMENT**

**PURPOSE:** the purpose of the Common Drug Formulary (CDF) is to provide high quality and best value pharmaceutical products while assuring the continuity and standardization of medication care.

**BACKGROUND:** In July 2001 the Department of General Services (DGS) begin the process to establish a Common Drug Formulary. Membership includes the Department of Mental Health, The California Department of Corrections and Rehabilitation, The Developmental Disability Services, the Department of Juvenile Justice and the California University System.

### **POLICY:**

1. Selection of all drugs for the CDF will emphasize patient safety, efficacy, high quality and best value.
2. The CDF items must be included on every participating department's formulary.
3. Individual state department's medical care facilities are prohibited from marking CDF and Departments formulary drugs non-formulary in the local drug file.
4. A CDF item may not be made non-formulary at the individual department level.
5. When the Department of General Services awards a contract for a therapeutic class or sub class, additional items from the same class or sub-class may not be added to an individual department's formulary. If the product is determined to be "medically necessary" the drug may be made available through a non-formulary process.
6. Members departments may include in their formulary drugs not in the CDF so long as they belong to therapeutic classes or sub classes not covered by the CDF or designated as open by the CDF. However these non-CDF drugs must be selected from DGS Contracted items if the drug is covered by a contract.
7. The CDF committee member's review of therapeutic drug classes and disease states may include best practice guidelines, outcome studies and other peer reviewed literature. These reviews may or may not lead to The Department of General Services contract initiatives.

8. Only the CDF and the member Department's Formularies are authorized for use. Local drug formularies at individual state department facilities must conform to the CDC and Department's Formulary if one exists.
9. Restrictions can be established at both the C D F and Member department's level, e.g. items that require close monitoring to ensure appropriate use, clinical guidelines and protocols.. Restrictions may include evidence-based use. However, other considerations being equal, including considerations of clinical efficacy, restrictions will be made based on economic issues.
10. If a patient transfers from one State Department to another, both formulary and approved non-formulary, pharmacotherapy will be continued when clinically appropriate, regardless of difference in State Department Formularies.
11. When a therapeutic interchange (TI) is required, the Practicing Clinicians and consultants will provide guidance to State Departments regarding essential elements of the conversion process.
12. Final decisions for the common drug formulary listing will be made by consensus (100% commitment by all member departments). If a consensus cannot be obtained the pharmacy advisory board will make the final decision on inclusion in the CDF.
13. The CDF Committee may maintain a list of proprietary pharmaceutical products for which generic substitution is not permitted.
14. All requests to add to the CDF will include criteria for drug use that addresses indications, monitoring, efficacy andr safety outcomes specific to the population served.
15. Pharmacological Therapeutic Classifications are descried by the American Hospital Formulary Service Index ( AHFS).
16. Closed therapeutic classes are specified by a 6 digit AHFS code. Any AHFS classification that is not listed as Closed in the CDF Classificationis considered open.
17. If a drug is in a closed therapeutic class, but is includes in another therapeutic class that is open, then the drug may be used in the open therapeutic class without requiring use of the non- formulary approval process.
18. The definition "available" is that the drug can be ordered.

19. Departments may restrict the use of CDF drugs through clinical guidelines. A copy of all department clinical restrictions and or guidelines(s) will be provided to the CDF Committee membership.

**DIVALPROEX SODIUM (DEPAKOTE & DEPAKOTE ER)  
and  
GAPABENTIN GUIDELINES**

Divalproex sodium (Depakote and Depakote ER) shall be reserved for treatment of:

- A. Individuals with a seizure disorder or other condition requiring more than two doses of valproic acid (Depakene) per day to maintain seizure control or clinical stability;
- B. Individuals demonstrated not to be able to tolerate valproic acid, [e.g.] due to tremor or gastro-intestinal symptoms;
- C. Individuals who suffer from a condition that would contraindicate treatment with valproic acid, [e.g.] gastro-esophageal reflux disease, active gastro-intestinal ulcerative disease, or gastritis;
- D. Or, in facilities unable to cost-effectively provide dosing more than once per day. In this last circumstance, Depakote ER may be added to the facility formulary with the approval of the director of the facility.

Background: Importantly, gabapentin has only modest anticonvulsant and anxiolytic effects. Note that gabapentin has been demonstrated not to be a mood stabilizer in multiple controlled trials. Moreover, gabapentin has not been shown to reduce assaultive behavior in forensic populations and has become a substantial drug of abuse among some forensic populations. Hence, the Common Drug Formulary has placed the following restrictions on the use of gabapentin.

Due to cost, Brand Neurontin is not on the Common Drug Formulary and must be requested and approved via department or agency nonformulary medication request procedures. Gabapentin (generic preparations) shall be reserved for:

- A. Treatment of individuals requiring adjunctive anticonvulsant treatment to adequately control a seizure disorder;
- B. Treatment of neuropathic pain, [e.g.] herpetic neuralgia, HIV-related neuropathy, or diabetic neuropathy;

## STATIN (HMG-CoA reductase inhibitors) GUIDELINE

There are currently 6 statins approved by the FDA for use in hyperlipidemia: Atorvastatin (Lipitor), Fluvastatin (Lescol), Lovastatin (Mevacor), Pravastatin (Pravachol), Simvastatin (Zocor), and Rosuvastatin (Crestor). Rosuvastatin, the most recently approved drug in this class, received FDA approval in August, 2003, and has had a high rate of myopathy in comparison to the other approved statins. For this reason, Rosuvastatin was excluded from consideration for inclusion in the formulary.

All of the drugs have a similar profile with regard to the most significant side effect, myopathy and rhabdomyolysis<sup>[1]</sup>, with the exception of rosuvastatin, which was excluded from consideration. Similarly, approximately 1% of patients using statins experience transaminase elevations, regardless of which statin is used<sup>[2]</sup>. The major differentiating factors between statins are drug interactions (primarily through activation of the cytochrome p450 pathway), dose adjustment requirements for renal insufficiency, the need to take with meals, and cost. Drug interactions are most critical with HIV patients on protease inhibitors, transplant patients taking cyclosporine, and patients who require anticoagulation.

### ***Lovastatin***

- Available generically, and approximately 1/3 of the cost of Atorvastatin and Pravastatin.
- Dose must be lowered for renal insufficiency
- Moderate potency
- Should be taken with meals
- Affects metabolism of drugs metabolized through cytochrome p450 system

### ***Atorvastatin***

- Most potent
- No adjustment for renal insufficiency
- No need to take with meals
- Some effect on metabolism of drugs metabolized through cytochrome p450 system

### ***Pravastatin***

- Moderate potency
- Dose must be lowered for renal insufficiency
- Little Cytochrome p450 effect (minimal effect on HIV and immunosuppressant Rx)
- Not highly protein bound (minimal effect on coumadin)
- No need to take with meals

**General guidelines for use:**

For patients needing mild to moderate reduction in cholesterol, i.e. 40% reduction or less, who have good renal function, and are not on protease inhibitors, coumadin, or cyclosporine, lovastatin should be used as the initial statin choice. If there is failure to achieve the target cholesterol on full doses of lovastatin, the patient should be changed to atorvastatin.

Patients who require more than a 40% reduction, and patients with renal insufficiency, should be treated initially with atorvastatin.

Pravastatin should be the initial statin of choice for patients who are on coumadin, protease inhibitors, cyclosporine, or other medications where induction of the cytochrome p450 enzyme system will impact drug metabolism and/or drug levels.

## RELATIVE COST

Cost codes used are "per month" of maintenance therapy (eg, antihypertensives) or "per course" of short-term therapy (eg, antibiotics). Codes are calculated using average wholesale prices (at the time of this revision for the most common indication and route of each drug at a typical adult dosage. For maintenance therapy, costs are calculated based upon a 30 day supply or the quantity that might typically be used in a given month. For short-term therapy ( $\leq 10$  days), costs are calculated on a single treatment course. When multiple forms are available (eg, generics), these codes reflect the least expensive generally available product. When drugs don't neatly fit into the classification scheme above, CDF have assigned code based upon the relative cost of other similar drugs. These codes could be used as a rough guide only, as (1) they reflect cost, not charges. (2) pricing often varies substantially from contract to contract and time to time. and (3) state procurement often negotiate quite different pricing.
